BICDROID

Technology Leader in Data Security

CYBERSECURITY SOLUTION SUMMARY

Accepting the reality that our cyberspace will never be safe and clean, our products pioneer the concept of data self-protection and are made instead to ensure that your data can co-exist with all known, unknown and looming threats without ever being attacked and compromised; they include QDocument (server editions, endpoint/mobile editions, etc.) and Quarantined Work Space (QWS), a leading remote work solution on the market. With our products, data activities take place in quarantined secure work and activity environments carved out dynamically and cryptographically on demand from your system execution environments.

SEEKING

We're looking to connect with direct customers to make direct sales, and with partners, channels and integrators to help us make direct or indirect sales. Because our products are easy to deploy and easily scalable, we're looking to partner with organizations of any size. Any organizations that sincerely care about their data or intellectual properties could be our potential customers. Any organizations that embrace bring your own PC (BYOPC) policies and allow remote work would find the value of BicDroid's QWS in its data security, productivity and economic benefits.

THREE TOP TAKEAWAYS

- 1 Our products protect your data against known, unknown, looming threats, including ransomware, malicious insiders and root attacks, irrespective of your network and system conditions, through a series of patented "quarantined security" technologies.
- 2 With their own secure kernel modules (Android, Windows, and Linux), and their central sentry platform, our products are efficient, scalable, easy to deploy, productive and economic. For example, with QWS, employees can even use their personal computers to work offline or online for employers anywhere and anytime without any data leak, even if employees want to act as malicious insiders.
- 3 Our products are proven by their adoption in hundreds of millions of devices. Join "Fortune Global 500" companies to have your data protected by our products, whether it is on servers, at endpoints or mobile.
